

A simple R markdown example

Aaron Peikert & Andreas M. Brandmaier

May 14, 2020

```
library("knitr")  
library("papaja")
```

Silly Heading

```
data("sleep")  
result <- t.test(extra ~ group, data = sleep)
```

This is an example of students' sleep data taken from `help(t.test)`.

$$\Delta M = -1.58, 95\% \text{ CI } [-3.37, 0.21], t(17.78) = -1.86, p = .079$$

I can now assert that what I *believe* to be true — that there is a difference in means between the groups — is **not** supported by the data.
