

# A simple R markdown example

*Aaron Peikert & Andreas M. Brandmaier*

*December 12, 2019*

```
library("knitr")  
library("papaja")
```

## Silly Heading

```
data("sleep")  
result <- t.test(extra ~ group, data = sleep)
```

This is an example of students' sleep data taken from `help(t.test)`.

$\Delta M = -1.58$ , 95% CI  $[-3.37, 0.21]$ ,  $t(17.78) = -1.86$ ,  $p = .079$

I can now assert that what I *believe* to be true — that there is a difference in means between the groups — is **not** supported by the data.
